PROJECTS

Detecting Adversarial Perturbations Using Context Consistency [C7]

- Defined, extracted and formulated context information from clean images to detect adversarially perturbed samples

ML-based Intrusion Detection System for Stealthy Attacks [WIP]

- Improving the detection accuracy/efficiency by constructing ML-based representations

Adversarial Examples Under Restricted Conditions [WIP]

- Improved the performance of adversarial machine learning under special requirements/circumstances

ML-based Automatic and Effective Adblocking [C6]

- Leveraged multiple layers of the web stack (HTML/HTTP/JavaScript) to train a classifier for blocking ads/trackers
- Replicated state-of-the-art filter lists with high accuracy (97.7%)
- Enhanced filter lists by automatically correcting their errors

Evading Deep Packet Inspection Systems Using Symbolic Execution [C5]

- Used symbolic execution to guide the generation of insertion and evasion packets at the TCP level for automated testing against DPI middleboxes
- Discovered over 20 strategies to elude DPI middleboxes that target Zeek (formerly Bro), Snort and GFW within an hour

Stealthy Adblocking [C4]

- Built invisible adblocker that evades current generation of anti-adblockers with 100% of success rate in manual evaluation
- Replicated 98.2% of ad coverage achieved by popular adblocking extensions, while causing minor visual breakage on less than 0.6% of Alexa top 1K websites. In the meantime, page loads are sped up by over 5% on average

Anti-Adblocker Measurement and Disruption via Dynamic Program Analysis [C3]

- Modified V8 engine to apply differential execution trace analysis in Chromium
- Launched large-scale (Alexa top 10K) measurement, revealed 5-52 times more anti-adblockers than reported in prior literature
- Experimented with countermeasures against anti-adblockers, achieved promising effectiveness
